

Smaller Smarter Smoother

The Shikani Speaking Valve

One valve. Infinite possibilities.™

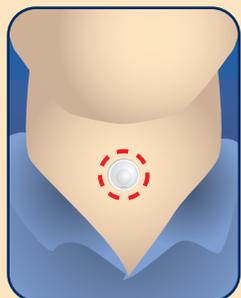

The
AirwayCompany
helping people breathe

The Shikani Speaking Valve™ is a patented, two-way valve that offers decreased work of breathing and the ability to adapt the flow and closure characteristics to each patient's individual needs. Benefits include:

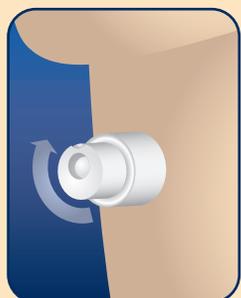

- Restored functional airway system
- Facilitated speech with enhanced naturalness
- Improved swallowing
- Improved olfaction
- Increased patient acceptance
- Reduced infections
- Managed secretions
- Reduced aspiration

In addition, the Shikani Speaking Valve™ features a smaller profile, smarter function, and smoother airflow.

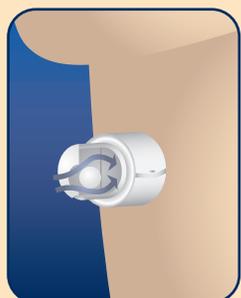

Smaller

The compact Shikani Speaking Valve™ was designed to be smaller and less conspicuous for daily use, offering a lower visual profile for the patient. The valve is available in White, Tan, or Blue depending on the level of visibility desired.

Smarter

The innovative Shikani Speaking Valve™ features an adaptable design that allows patients and clinical professionals to easily control airflow and closure performance. By changing the valve's orientation on the inner cannula, tracheotomy patients can adjust the flow and closure characteristics to achieve their optimal breathing and speech setting.

Smoother

The patented Shikani Speaking Valve™ utilizes a unidirectional ball design which offers lower airflow resistance as compared to existing membrane-flapper or disc type valves. This enables patients to inhale with greater ease, allowing for an improved overall breathing experience and subjectively better voice.

The Shikani Speaking Valve™ is available in three colors:

White

Tan

Blue

The Shikani Speaking Valve™ is covered under one or more claims in U.S. Patent No. 5,505,198. This brochure and all product names, designs, images, and slogans are trademarks and/or copyrights of The Airway Company, a division of Shikani Medical, LLC. All rights reserved.
